Bridges and cable- pipe overhead have the attribute refgag.

EG

[Q.EU](#): If there is a gauge which can be used to calculate the vertical clearance of the bridge, the ISRS location code of the gauge shall be encoded in the attribute REFGAG.

A lot of bridges in the Netherlands are depended of more than one wtwgag to make such an clearance caluculation.

Question Is it possible to fill in more rhan one wtwgag ISRSlocation codes?

I suppose not.

In that case we should add some text like : "Only use this refgag if the wtwgag is near the object."

Dear René,

theoretically it would be possible to fill in two ISRS location codes, but I am afraid that applications would not be able to use the information correctly.

Could application builders provide more information?

The proposed amendment would also be correct, if there is only one refgag from my point of view.

Best regards

Bernd
