In the encoding instructions of I.1.4 Fairway point D tells us that the attribute DRVAL1 of the FAIRWY object class should not be used. As far as I can see, the feature FAIRWY has no DRVAL1 attribute defined (see feature catalogue).

I suppose that the instruction wants to point out that DEPARE has to be used in addition with FAIRWY (see C) and that DRVAL1 can be used in combination with DEPARE?

Yes, seems to be correct. When a FAIRWY is defined and encoded and no detailed bathymetry available then the geometry of the FAIRWY has to be encoded with I.1.5 Fairway Depth/Project Depth -> DEPARE (with attributes DRVAL 1 and DRVAL 2), see also instructions E at I.1.4. BR, Johannes
